Examiner's Amendment

An Examiner's Amendment to the record appears below. Should the changes and/or additions be unacceptable to applicants, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it must be submitted no later than the payment of the Issue Fee.

Claims 7-12 have been canceled as being drawn to a non-elected invention.

Reasons For Allowance

The invention in this case is a gas turbine engine component comprising a flange arm with a channel in its radially inner surface. In the preferred embodiment of Figure 3, the flange arm and channel correspond respectively to elements 61 and 74, which form parts of a rotary seal assembly 66 in the engine's turbine section. Flange arm components are common in gas turbine structure as shown, for example, by element 11 in Figure 1 of Schmitt and element 47 in Figures 4 and 5 of Bobo et al (see PTO-892). Note that Bobo's flange arm further includes channels 67 on the arm's radially inner surface. None of the references of record however show or fairly suggest a gas turbine component comprising a flange arm with a channel on its radially inner surface and further including an inlet passage extending through the flange arm in fluid

communication with the channel along with an outlet slot in the radially inner surface and also in fluid communication with the channel as specified by the present claims.

The claimed invention is therefore considered patentable over the prior art.
